Home food introduction for eggs and milk
A guide for parents and children

Food for home Challenge:

What is home food introduction?
Home food introduction is the introduction of a food that we believe your child is not allergic to into your child's diet at home.

Why are we recommending a home food introduction for your child?
We have performed allergy tests which make us believe that your child is either not allergic to, or has grown out of being allergic to, the food that we are recommending you introduce at home.

This leaflet will guide you through the home food introduction process.

When to perform the home food introduction?
- Ensure your child is well with no illness.
- Ensure that their eczema, asthma or hay-fever has not flared up.
- If your child has needed to use a salbutamol (Ventolin) or terbutaline (Bricanyl) blue inhaler in the last three days then delay the introduction.

Medications
It is important that your child is not currently taking certain medicines before you proceed.

- Antihistamines:
  1. Short acting antihistamines e.g. chlorphenamine (also known as Piriton or Allerief), alimemazine (Vallergan), promethazine (Phenergan)
  2. Long acting antihistamines e.g. cetirizine (Zirtek), loratadine (Claritin) and ketotifen

Some other over the counter medicines, such as cough mixtures and cold remedies, also contain antihistamines. If in doubt check with us or ask your pharmacist.

- Short acting antihistamines need to be stopped 48 hours before the home food introduction, and long acting antihistamines need to be stopped a week before. Again check with us or ask your pharmacist if you are not sure.

Continue to give your child any other regular medications that they are taking or applying (such as emollients and topical steroids).

Where shall I perform the home introduction of food?
Perform the home introduction in your home on a day that you have time to dedicate to your child and observe them after they have eaten the food.

Please ensure you have easy access to your child's emergency medications, as stated on your child's emergency plan, in case of an allergic reaction.

Start food introduction before 2pm.
How to perform the home introduction of food?

Only introduce one food at a time, and leave at least three days between separate food introductions. If your child refuses to eat the food do not force them. Try again another day.

- Start by rubbing a small amount of the food onto your child’s inner lip (not swallowed if possible), and wait for five to ten minutes.
- If there is no reaction, give your child a tiny portion of the food (pin-head size or one drop) and wait five to ten minutes.
- If there is no reaction, give your child a pea sized portion of food to eat or half a teaspoon to drink and wait five to ten minutes.
- Double the dose every five to ten minutes until they have eaten either:
  - two tablespoons in total of the food
  - 180ml (six ounces) to drink
  - or as much as they can hold in their hand

Observe your child for two hours after giving them their final dose.

There are some suggested foods and more specific amounts in the table below.

<table>
<thead>
<tr>
<th>Home food introduction</th>
<th>Suggested food to introduce</th>
<th>Build up to final dose:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Plain/cooked egg</td>
<td>Hard boiled medium egg (10 minutes in boiling water)</td>
<td>30 grams or 1 hard boiled egg</td>
</tr>
<tr>
<td>Milk</td>
<td>Shop bought full fat pasteurized cow’s milk</td>
<td>180ml (6 ounces)</td>
</tr>
<tr>
<td>Soya</td>
<td>Shop bought fresh soya milk e.g. Alpro, Provamel, Tesco’s own, Sainsbury’s own</td>
<td>180ml (6 ounces)</td>
</tr>
<tr>
<td>Wheat</td>
<td>Weetabix, plain dried pasta</td>
<td>1 Weetabix (37.5g/biscuit) or 20 grams</td>
</tr>
<tr>
<td>Sesame</td>
<td>Hummus, sesame seed snaps (not appropriate for children under two years old)</td>
<td>10 grams (two teaspoons)</td>
</tr>
</tbody>
</table>
What do I do if my child has an allergic reaction to the food?

**Mild to moderate allergic reaction**

**SIGNS**
- Swelling (lips, face or eyes)
- Rash (Hives) or welts
- Abdominal pain or vomiting

**ACTION**
- Stay with child and call for additional help if child is worsening
- Give antihistamine (if vomited repeat the dose).
- If your child has asthma give six to ten puffs of salbutamol.

**Severe allergic reaction (anaphylaxis)**

**SIGNS**
- Difficulty/noisy breathing
- Swelling of tongue or tightness of throat
- Difficulty talking and/or hoarse voice
- Wheeze or persistent cough
- Loss of consciousness and/or collapse
- Pale and floppy (young children)

**ACTION**
- If you have an adrenaline auto-injector (Epipen, Jext or Anapen) then administer this immediately.
- Lay child flat and raise legs if breathing is difficult, allow to sit but do not stand.
- Dial 999 for an ambulance.
- If your child has not improved in five to ten minutes give second adrenaline autoinjector.
- If your child has asthma then also give six puffs of salbutamol using a spacer.

*If you are unsure whether your child is having an allergic reaction, stop giving the food.*

What to do if my child has a delayed allergic reaction to the food?

Delayed allergic reactions usually occur at least two hours after consuming the food but can occur up to 72 hours after the food has been introduced.

Delayed reactions include worsening eczema, stomach pains, vomiting or loose stools.

If your child is having a delayed reaction, go back to the dose of the proposed food that they previously tolerated. If you are unsure please contact us.

Children’s Allergy service

Following your home challenge if there are any problems, or concerns that you would like to discuss please contact the Allergy Clinical Nurse Specialists on: **01392 402682**

If you have any concerns, complaints or commendations about the children’s allergy service please contact the Patients Advice Liaison Service (PALS). Tel: **01392 402093** (Available from 9:30am - 4:30pm) Email: rde-tr.PALS@nhs.net
